You have just been diagnosed with CANCER! The big "C." It's not someone else - it's YOU, and if you just sit there stunned, you will DIE!! - Miserably! You must do something, so you start asking around to find out your options. You have only two:1. Let someone else decide what is best for you and give in to chemo, surgery, radiation, and all the accompanying medical horrors.2. Take matters into your own hands, and save yourself. If you decide to take charge of your own life, start by reading Outsmart Your Cancer. It is the result of some amazing research by Tanya Harter Pierce. This information would take years to find for yourself. The book is complete with information on all

the major alternative non-toxic cancer treatments available today. This is a wonderful book. I am still alive today because I used one of the approaches described in Outsmart Your Cancer - I chose the Protocel treatment because it is backed by solid science, and it is a therapy compatible with my busy lifestyle. The book has an excellent description of Protocel, its history, how to take it, and how-and-why it works. Almost 18 months ago I was diagnosed with breast cancer (the tumor was larger than a big, solid walnut). Hoping to ward-off surgery, I went for chemotherapy. It was a lethal combination of three of the most deadly concoctions ever devised by humans. The side-effects are unspeakable. After 5 months of chemo, there was little change in the tumor, and radical surgery was indicated. Somehow death was not as scary as the radical surgery, radiation, and more chemo. I refused. Two days later I read Tanya Harter Pierce's description of Protocel, and I got my life back.

Most people who read this book either have cancer or know someone with it. If they're reading this book they must already have some idea that the conventional treatments (slash, burn and poison) have limited success and significant risk of doing more harm than good. Ms. Pierce is especially good at explaining how statistics are skewed to make products look good when they are backed by "Big Pharma". Patients are apparently told to take a toxic chemical because of a good "tumor response rate", when the truth is that you often cannot kill all the cancer cells before you kill too many normal cells. Then the ones that survive live to another day and because they are a special breed with resistance to the chemo, they multiply and come back stronger than ever. I have seen this myself in a friend who went through several chemo treatments and then died. I also know a few people who were successfully cured of cancer by chemotherapy, however they were all young people suffering from either Hodgkins or testicular cancer (like Lance Armstrong). These cancers are likely curable because they affect mostly the young and the young are better able to live through the poisoning effect. I have often thought that there must be less dangerous cures for older, less vigorous people, although slower. Well, here they are in this book. Contrary to what some may think, Ms. Pierce doesn't completely reject the conventional treatments, as they might be useful in situations where the slow method can't work because of the fast progression of the disease. However she gives useful information and questions to ask the doctor so that a patient may determine if this is necessary and also may determine if they are being put through misery for nothing because the chemo may not really have much chance of helping.

In my opinion, reading this book could very easily mean the difference between life and death. This book is extremely well written (and believe me when I say that I am a perfectionist), and it gives

several resources for each approach to cancer. What I think is great about non-toxic treatments is that they won't poison you like chemo, so you can saturate the blood with such substances, and not die... which of course is in contrast to chemo that usually kills you before the cancer gets the chance. Almost all of these treatments are combinable, and many of the ways to "outsmart your cancer" are unbelievably effective on even the worst forms of metastasized cancers, which promises radiant hope to even the most hopeless cancer patients out there. Many people do not yet know that cancer does indeed have numerous characteristics that healthy cells don't have, so outsmarting cancer is a simple task. Cancer gets its energy anaerobically from fermentation rather than by oxygen, so it makes only 1 ATP molecule per glucose instead of 32 that a healthy cell would make. Cancer is the only type of cell in the human body that has a negatively charged protein coating on it... it is the only cell that produces chorionic gonadotrophic hormone in any abundance... etc. My point in this is that cancer cells are very different from normal cells, and there are dozens of ways to effectively "outsmart them"... in this book, Tanya Pierce does an excellent job explaining the why behind some of the most effective therapies available anywhere. I rate this book as superb because she explains the why... WHY these therapies are so effective. She also gives the factual suppression of these therapies in a very subtle tone that I think any nonbeliever in these therapies would find refreshingly interesting.
